Web App Development

9th October 2023

Hello Sir/Madam,

I hope you like my website.

My aim was to make a personal website that I can keep updating as this academic year progresses.

There is a home page (index) and it can be accessed from the other pages by pressing the cartoon profile of myself or just pressing the "home" button.

There is a sticky navbar on each page, a list used in the navbar and a list used in the gallery page and there are several inline and block elements.

Other than that there are 4 other pages; an about page with a relevant table, a contact page with links to external sites, a gallery page with more links to external sites and a selection of images in a structured format. Lastly there is a "trailers" page that has 3 embedded videos.

Overall I believe I have included the required 5 CSS3 specific elements (Radial Gradient (line 12), Drop Shadow (line 68), Flex (line 95 + 98), background-size (line 13) and Box Shadow (line 77)) and 4 HTML5 elements ("about.html" <aside> (line 77), "index.html" <header> (lines 45 - 47), "index.html" <footer> (line 62 - 64), and <main> on each page). The footer might look redundant since its opacity is 0 but it actually makes the nav behave better (it stops a gap from forming at the bottom when you scroll down).

Thank you.
